

Silicon Craft Technology Public Company Limited

Waste separation is a key to reducing waste because it will be sent for the correct management process, such as recycling. In 2021, the Company set up a project to separate waste by providing five types of waste bins, namely 1) General waste, 2) Recycling waste, 3) Hazardous waste, 4) Electronic waste, and 5) Infectious waste, which is especially necessary during the COVID-19 epidemic for disposing of ATK test kits and masks. The Company coordinates with the municipality to have trucks regularly collect all types of waste. In addition, the name for each type of waste is written on the front of garbage bags to facilitate the waste management process. Moreover, the Company has weekly public relations through internal e-mail about the waste separation process in a bid to have employees from all sectors perceive, understand, realize, be aware, and foresee the benefits of waste separation.
